As the new central form of the main administration building of the City of Hangzhou, capital of Zhejiang Province, the Congress Centre resembles a large precious stone.

The Zhejiang Province is known for its tea producing region. To express the building's regional characteristics, design of the façade is based on the superimposed configu-

rations of the tea cultivation pathways and the planting nets. As a result, the building is enveloped by a multi-layered fabric, giving it a true architectural plasticity. Seen from a distance, the façade appears like a rigid volume, but dissolves into a network of structures and levels on approach.
